1. Executive Summary

ABC Company is a full-service technology agency founded in 2015 and headquartered in Colombo, Sri Lanka, with additional offices in London, United Kingdom, and Melbourne, Australia. Over nine years of sustained operation, the company has evolved from a four-person startup into a globally distributed team of sixty technology professionals, delivering more than 150 projects for over 40 active clients across four continents. ABC Company's growth trajectory reflects both the depth of its technical capabilities and the enduring relationships it builds with clients who return engagement after engagement.

The company specialises in architecting and delivering custom software solutions for startups, scaleups, and enterprise organisations that require more than commodity development. ABC Company operates across eight industry verticals — Fintech, Healthcare, E-Commerce, SaaS, Logistics, EdTech, PropTech, and Media and Entertainment — bringing domain-specific knowledge and proven engineering patterns to every engagement. This vertical depth, combined with a commitment to transparency, named dedicated teams, and full intellectual property transfer, positions ABC Company as a strategic engineering partner rather than a simple outsourcing vendor.

This document provides a comprehensive overview of ABC Company's history, global footprint, service capabilities, industry credentials, and the principles that guide the company's work. It is intended for prospective clients, existing partners, and other stakeholders seeking to understand the full scope of what ABC Company brings to a software engagement.

2. Company History and Milestones

The following narrative traces ABC Company's growth from a four-person Colombo startup to a sixty-strong globally distributed technology agency, across nine years marked by deliberate strategic expansion, deepening technical capability, and a consistent focus on client outcomes.

2015 — Foundation

ABC Company was founded in Colombo, Sri Lanka, in 2015 by a team of four software engineers with a shared conviction that high-quality, enterprise-grade software development could be delivered from South Asia with the same rigour and communication standards that clients expected from firms in Western Europe and North America. In its inaugural year the company focused on web application development for local businesses, building a reputation for clean code, on-time delivery, and honest estimation. These early projects, though modest in scope, established the working practices and quality culture that continue to define ABC Company today.

2016 — First International Client

ABC Company's reputation for quality reached a UK-based fintech startup in 2016, marking the company's first international engagement. This project was a watershed moment, demonstrating that remote-first delivery across time zones was not only viable but could produce outcomes that matched — and in some cases exceeded — those of locally staffed teams. By the end of 2016 the team had grown to twelve engineers and designers, and the company had established the structured communication cadences, documentation standards, and client-facing rituals that remain central to its delivery model.

2017 — Mobile Development and React Native Adoption

Responding to growing client demand for mobile-first experiences, ABC Company expanded its service offering in 2017 to include native and cross-platform mobile development. After evaluating the available frameworks, the company adopted React Native as its primary mobile development framework, enabling a shared codebase for iOS and Android while maintaining near-native performance. This strategic choice proved prescient: mobile projects now represent a significant and growing share of the company's portfolio, and ABC Company's React Native practice is one of the most seasoned in the region.

2018 — London Office and ISO 27001 Certification

To better serve its growing European client base, ABC Company opened its first international office in London in 2018. The London team focused on client relationship management, business development, and on-site consulting, providing European clients with a local point of contact while the core engineering capability remained in Colombo. That same year, the company achieved ISO 27001 certification — the international standard for information security management — a significant milestone that formally validated the security practices already embedded in the company's delivery processes. By year-end the team had reached 25 professionals.

2019 — Healthcare Vertical and DevOps Practice

2019 saw two important additions to ABC Company's capability portfolio. The company established its Healthcare vertical with the delivery of MediConnect, its first HIPAA-compliant patient portal. This engagement required the team to develop deep expertise in healthcare data privacy regulations, EHR integration standards, and the specific security controls that healthcare organisations must demonstrate. Concurrently, ABC Company launched a dedicated DevOps practice, embedding infrastructure-as-code, CI/CD pipeline design, and cloud architecture review into its standard engagement model, rather than treating operations as an afterthought at the end of a development cycle.

2020 — Remote-First Pivot and AI/ML Practice

The global disruptions of 2020 forced many technology organisations to scramble toward remote work. ABC Company, having operated with distributed teams since its founding, was uniquely positioned to help clients navigate this transition. The company grew 40 percent year-on-year by rapidly onboarding clients who needed to accelerate their digital transformation or pivot their products to meet new market demands. It was also in 2020 that ABC Company established its AI and Machine Learning practice, initially focused on data pipeline architecture and classical ML model integration, and subsequently expanding into large language model-based applications. The team reached 35 professionals by year-end.

2021 — Melbourne Office and AWS Advanced Partner

ABC Company extended its global footprint to the Asia-Pacific region in 2021 with the opening of its Melbourne office, enabling the company to serve APAC clients during Australian business hours and to contribute to a follow-the-sun delivery model for high-intensity engagements. That same year the company achieved AWS Advanced Consulting Partner status, recognising twelve certified Solutions Architects on staff and a track record of delivering production workloads on AWS infrastructure. The 100th project milestone was also reached in 2021, a testament to the accelerating pace of delivery as the team grew to 45 professionals.

2022 — LLM Integration and Google Cloud Partnership

The emergence of large language model capabilities transformed the AI/ML landscape in 2022, and ABC Company moved quickly to build practical LLM integration expertise. The company developed reusable patterns for retrieval-augmented generation, prompt engineering, LLM fine-tuning workflows, and agentic pipeline design, capabilities that now underpin a growing share of its product engineering engagements. ABC Company also achieved Google Cloud Partner certification that year, with three certified engineers added to a cloud capabilities team that could now architect and operate production workloads across the two largest enterprise cloud platforms.

2023 — Clutch Recognition and Enterprise Tier

Third-party validation arrived in 2023 when Clutch, the leading B2B research and review platform, recognised ABC Company as a Top B2B Technology Services Company based on verified client reviews and delivery track record. This recognition reflected consistent 4.9-star average client ratings accumulated over multiple years. The company also formally introduced an Enterprise client tier in 2023, adapting its engagement model to serve large organisations with more complex governance, procurement, and compliance requirements. The team reached 55 professionals.

2024 — 150+ Projects, Staff Augmentation, and CTO-as-a-Service

By 2024, ABC Company had delivered more than 150 projects spanning eight industry verticals, and the organisation continued to evolve its service offering to match emerging client needs. The company launched a Staff Augmentation service to help clients who needed to embed experienced engineers directly into their internal teams without the overhead of a full managed-project engagement. ABC Company also introduced a CTO-as-a-Service offering, providing startup and scaleup clients with part-time fractional CTO support — covering technology strategy, architecture review, hiring guidance, and vendor selection — at a fraction of the cost of a full-time executive hire. The team reached 60 professionals.

3. Global Presence

ABC Company operates from three offices across three continents, providing clients with localised client service, broad timezone coverage, and a follow-the-sun development capability that enables near-continuous productivity on high-intensity engagements.

Colombo — Global Headquarters

Team Size	45 team members
-----------	-----------------

ABC Company's Colombo headquarters serves as the primary development center and the operational heart of the organisation. Housing 45 of the company's 60 professionals, the Colombo office is home to full-stack engineering teams across all eight verticals, dedicated quality assurance engineers, UX/UI designers, business analysts, and project management professionals. Located in Colombo's growing technology corridor, the office operates on Central European Time (CET) overlap hours, typically covering 7:00 AM to 4:00 PM CET, enabling real-time collaboration with clients in the United Kingdom, continental Europe, and the Middle East during standard business hours.

The Colombo team maintains the company's core engineering competencies: backend architecture in Python, Node.js, and Java; frontend development in React, Vue, and Angular; mobile development in React Native and Flutter; cloud infrastructure on AWS and Google Cloud; DevOps and CI/CD pipeline engineering; and the growing AI/ML and LLM integration practice. The co-location of these disciplines in a single office enables rapid cross-functional collaboration, shorter internal feedback loops, and the kind of spontaneous knowledge transfer that sustains a strong engineering culture.

London — European Client Hub

Team Size	10 team members
-----------	-----------------

The London office, located at 71 High Holborn in the heart of the city's legal and financial district, serves as ABC Company's client-facing presence for European engagements. The ten-person team comprises business development managers, account managers, solutions consultants, and on-site consulting resources who can attend client meetings, workshops, and discovery sessions in person. This local presence is particularly valued by financial services and enterprise clients in the UK and continental Europe who require face-to-face engagement during contract negotiation, discovery, and major project milestones.

The London team operates during GMT/BST business hours, providing an overlap window with both the Colombo development teams and North American clients in Eastern Standard Time zones. This overlap capability means that European clients working with ABC Company benefit from having a responsive local contact available throughout their working day, backed by a full engineering team that is simultaneously active in Colombo.

Melbourne — APAC Operations

Team Size	5 team members
-----------	----------------

Opened in 2021, the Melbourne office at 120 Spencer Street anchors ABC Company's presence in the Asia-Pacific region. The five-person APAC team handles regional business development, client relationship management for Australian and New Zealand accounts, and provides a development bandwidth contribution that completes the company's follow-the-sun delivery model. Operating in Australian Eastern Standard Time (AEST), the Melbourne team is active during hours when both the London and Colombo offices are offline, enabling near-24-hour development throughput for clients engaged on high-velocity or time-sensitive projects.

The follow-the-sun model is one of ABC Company's most operationally distinctive capabilities. When a client in London finishes their working day and hands off outstanding tasks, the Colombo team is in the middle of its productive afternoon. When Colombo closes, the Melbourne team is beginning its morning. This geographic distribution means that urgent engagements — production incidents, critical-path feature delivery, or pre-launch sprints — can sustain a near-continuous development cadence without requiring any individual engineer to work unsociable hours.

4. Industry Verticals

ABC Company's vertical practices are not marketing categories — they represent accumulated domain knowledge, reusable architecture patterns, and prior regulatory experience that meaningfully accelerates project delivery and reduces technical risk for clients in each sector. The following sections describe the company's capabilities and representative delivery outcomes across all eight verticals.

1. Fintech

ABC Company's Fintech practice is one of its most established and technically demanding verticals, built on nine years of delivering payment infrastructure, banking applications, and regulatory compliance systems for clients ranging from seed-stage startups to Series C-funded scaleups. The practice encompasses payment gateway integration and white-label payment platform development, core banking system modernisation, PCI-DSS compliant card data environments, FX and transaction processing systems, KYC/AML workflow automation, and open banking API implementations. ABC Company's Fintech engineers hold deep familiarity with the Stripe, Adyen, and Worldpay ecosystems, as well as the regulatory frameworks governing electronic money institutions in the UK, EU, and Sri Lanka.

A flagship example of the Fintech practice's capabilities is NovaPay, a white-label payment platform developed for a European payments provider. The NovaPay platform processes more than €8 million per day across multiple merchant categories, with a 99.97% uptime record since launch. The architecture features event-driven transaction processing via Apache Kafka, real-time fraud scoring using a custom ML model, and a PCI-DSS Level 1-compliant card data vault. This engagement exemplifies the Fintech practice's ability to deliver production-grade financial infrastructure under regulatory scrutiny.

2. Healthcare

The Healthcare vertical was established in 2019 with ABC Company's first HIPAA-compliant engagement and has since grown into a practice with expertise spanning patient portal development, telemedicine platform architecture, Electronic Health Record (EHR) integration via HL7 FHIR and legacy EDI standards, clinical workflow automation, and population health analytics. Healthcare clients demand more than technical skill — they require a development partner that understands the governance, auditability, and data minimisation obligations that accompany health information. ABC Company's Healthcare engineers are trained in HIPAA Privacy and Security Rule requirements and embed privacy-by-design principles from the earliest stages of system architecture.

MediConnect, a patient portal serving 3,500 patients across a network of community health clinics, represents the Healthcare practice's capabilities in a production context. The platform integrates with three separate EHR systems via FHIR R4 APIs, supports secure patient messaging, appointment scheduling, prescription refill requests, and telehealth video consultations, all within a HIPAA-compliant cloud environment with end-to-end encryption, comprehensive audit logging, and role-based access controls. Patient satisfaction scores improved by 34% following the platform's launch, and administrative burden on clinic staff was reduced by an estimated two hours per day per clinic.

3. E-Commerce

ABC Company's E-Commerce practice serves both B2C and B2B marketplace operators, direct-to-consumer brands, and retail technology providers requiring custom commerce infrastructure that out-of-the-box platforms cannot accommodate. Capabilities include headless commerce architecture, multi-vendor marketplace platform development, inventory and warehouse management system integration, payment orchestration across multiple providers, search and recommendation engine optimisation, cart abandonment and conversion rate optimisation, and post-purchase logistics integration. The practice team has deep experience with high-traffic scenarios, having designed and load-tested systems serving tens of thousands of concurrent users during promotional events.

TradeNest, a B2B wholesale marketplace connecting manufacturers with regional distributors, illustrates the E-Commerce practice's technical depth. The platform handles complex multi-party pricing rules, minimum order quantity enforcement, tiered discount structures, and bulk purchase workflows that standard commerce platforms cannot support without prohibitive customisation. After ABC Company redesigned the platform's data access layer and implemented a Redis-backed caching strategy, page load times decreased by 40%, a performance improvement that directly contributed to a 22% increase in session-to-order conversion rates within the first quarter post-launch.

4. SaaS

Building multi-tenant SaaS products requires a particular combination of architectural discipline — getting tenant isolation, data partitioning, and feature flagging right from the start — and the ability to move quickly through early product iterations without accumulating technical debt that slows down future growth. ABC Company's SaaS practice has delivered analytics dashboards, operations management platforms, subscription billing and usage metering systems, multi-tenant B2B platforms with role-based access and white-labelling, and API-first integration layers that allow SaaS products to connect into enterprise client toolchains. The practice has particular depth in time-series data architecture, event tracking pipelines, and the data visualisation layer.

InsightFlow, a business intelligence and analytics SaaS platform built for a UK-based data consultancy, demonstrates the SaaS practice's output. The platform serves 10,200 daily active users across 340 tenant organisations, with each tenant maintaining fully isolated data environments and customisable dashboard configurations. InsightFlow has reached \$2.4 million in annual recurring revenue since its launch, and the platform's architecture — built on a PostgreSQL multi-schema tenancy model, a ClickHouse analytical query layer, and a React-based dashboard builder — continues to support the client's roadmap without requiring foundational re-architecture.

5. Logistics

The Logistics vertical addresses the technology needs of freight operators, last-mile delivery providers, third-party logistics companies, and fleet operators who require custom software to manage the complexity that off-the-shelf logistics platforms cannot handle. ABC Company's Logistics engineers have built fleet management systems with real-time GPS tracking, dynamic route optimisation engines using graph-based algorithms, warehouse management systems with barcode and RFID integration, proof-of-delivery mobile applications, carrier rate comparison and booking APIs, and customer-facing shipment tracking portals. A common thread across these engagements is the need to process and act on high-frequency telemetry data at low latency.

SwiftRoute, a route optimisation and fleet management platform built for a regional logistics operator, achieved a 23% improvement in route efficiency within six months of deployment, reducing fuel costs and enabling the operator to service 18% more delivery stops per day with the same fleet size. The platform processes GPS telemetry from 340 vehicles in real time, applies dynamic re-routing when traffic conditions or delivery exceptions occur, and exposes a driver-facing mobile application for proof-of-delivery capture and customer communication. Integration with the operator's existing ERP system ensures that dispatch, billing, and compliance reporting remain synchronised without manual data entry.

6. EdTech

Education technology demands a unique combination of accessibility, engagement design, and backend scalability, as platforms must perform reliably when entire student cohorts access them simultaneously for live sessions or assessment events. ABC Company's EdTech practice has designed and delivered learning management systems, AI-powered adaptive tutoring platforms, virtual classroom environments with integrated video conferencing, assessment and proctoring systems, content management and curriculum authoring tools, and student progress analytics dashboards. The practice team has expertise in SCORM and xAPI standards for interoperability with third-party content libraries and assessment platforms.

LearnSpark, an adaptive learning platform serving 52,000 students across a network of secondary schools, is ABC Company's largest EdTech deployment by user volume. The platform uses a combination of item response theory and large language model-based tutoring to personalise learning pathways for each student, adjusting content difficulty and hint generation in real time based on performance signals. Teacher dashboards provide granular visibility into student progress, flagging at-risk learners before they fall significantly behind. Schools using LearnSpark reported a 19% improvement in standardised assessment outcomes in the first academic year of deployment.

7. PropTech

Property management companies, real estate platforms, and built environment operators face growing pressure to digitise workflows that have historically relied on paper, phone calls, and disconnected spreadsheets. ABC Company's PropTech practice builds tenant-facing portals, property management back-office systems, maintenance request and work order automation platforms, lease management and document generation tools, rental payment processing integrations, and portfolio analytics dashboards for property investors. The practice also supports smart building IoT integrations, connecting access control, environmental monitoring, and energy management systems into unified management interfaces.

DwellDesk, a comprehensive property management platform built for a residential property manager overseeing 1,200 units across multiple properties, has achieved a 97% rent collection rate since deployment — up from 82% with the legacy manual process. The platform automates rent reminders, processes payments via direct debit and card, manages maintenance request intake and work order dispatch, tracks contractor assignments, and generates compliant tenancy documentation. The landlord-facing analytics module provides real-time portfolio performance data, vacancy tracking, and maintenance cost analysis, enabling evidence-based decision making that was previously impossible without significant manual data aggregation effort.

8. Media and Entertainment

The Media and Entertainment vertical serves digital publishers, content platforms, streaming service operators, and media organisations that need custom technology to create, manage, distribute, and monetise content at scale. ABC Company's capabilities in this vertical include headless CMS architecture and custom content management platform development, video streaming infrastructure and adaptive bitrate delivery integration, digital publishing workflow automation, subscription and paywall management systems, advertising operations tooling and yield management integrations, and audience analytics platforms. The practice team has experience with both broadcast-scale content operations and the leaner architectures appropriate for independent digital publishers.

Engagements in this vertical frequently require managing large content libraries with complex metadata, taxonomy, and rights management requirements, alongside the performance demands of delivering rich media to large concurrent audiences. ABC Company has built systems that integrate with CDN providers, transcode video at ingest, serve personalised content recommendations using collaborative filtering models, and provide editorial teams with intuitive authoring interfaces that abstract away the underlying infrastructure complexity. As AI-generated and AI-augmented content becomes more prevalent, the practice is also developing capabilities in AI-assisted content generation, moderation, and discoverability tooling.

5. Certifications and Partnerships

ABC Company’s certifications and technology partnerships are maintained as an ongoing investment in the company’s credibility, capability, and commercial standing. Each certification listed below requires active maintenance, meaning that the recognition reflects the company’s current practice standards, not historical achievement alone.

Certification	ISO 27001
Scope	Information Security Management System
Achieved	2018

ISO 27001 certification confirms that ABC Company operates a formally documented and independently audited Information Security Management System (ISMS). For clients, this means that the company has implemented systematic controls governing how client data, source code, infrastructure credentials, and confidential project information are handled, stored, and disposed of. The certification requires annual surveillance audits and a full re-certification every three years, ensuring that controls remain effective as the organisation grows and its technology landscape evolves.

Certification	AWS Advanced Consulting Partner
Scope	12 Certified Solutions Architects
Achieved	2021

AWS Advanced Consulting Partner status places ABC Company among a select tier of AWS partners globally, recognising a combination of technical certification depth, customer success track record, and commitment to cloud best practices. For clients, AWS partnership means access to architectural guidance informed by direct engagement with AWS technical account managers, eligibility for AWS funding programs that can offset proof-of-concept costs, and the assurance that ABC Company’s cloud engineers are maintaining current certification across the AWS service portfolio.

Certification	Google Cloud Partner
Scope	3 Certified Engineers
Achieved	2022

Google Cloud Partner certification extends ABC Company’s multi-cloud capability, enabling the company to architect and operate production workloads on Google Cloud Platform with the same rigour applied to AWS deployments. Clients with existing Google Workspace environments, BigQuery analytical workloads, or Google Kubernetes Engine infrastructure benefit from ABC Company engineers who are certified on the specific services their systems depend upon, rather than relying on general cloud knowledge.

Certification	Clutch Top B2B Company
Scope	Technology Services Provider Recognition
Achieved	2023

Clutch's Top B2B Company recognition is determined by verified client reviews, independently collected by Clutch analysts through direct interviews with past and current clients. ABC Company's recognition reflects a consistent 4.9-star average across reviews spanning multiple years and multiple industry verticals, with reviewers consistently citing communication quality, technical expertise, delivery reliability, and the character of the working relationship as distinguishing factors.

6. Why Choose ABC Company

There is no shortage of technology services firms competing for software development engagements. The following differentiators explain, concretely and without marketing abstraction, what clients consistently cite as the reasons they choose ABC Company and why they return for subsequent engagements.

1. Fast Ramp-Up

One of the most common frustrations in software outsourcing is the time it takes to get a capable team in front of the work. ABC Company has engineered its talent pipeline and onboarding processes to address this directly. In most engagements, the company can onboard two to three experienced engineers within two weeks of contract execution, with team leads often available within days. For surge capacity — sprint acceleration, short-term staff augmentation, or parallel workstream delivery — ABC Company maintains a vetted contractor network of pre-screened engineers who can be mobilised quickly without compromising quality standards. This capability is particularly valued by clients facing product launch deadlines, post-funding scaling events, or unplanned engineering capacity gaps.

2. Transparent Pricing

ABC Company operates with a degree of commercial transparency that is uncommon in the technology services market. Before an engagement begins, clients receive a detailed rate card broken down by role and seniority level, a structured estimation document that explains the methodology behind every line-item projection, and a clear statement of what is and is not included in the engagement scope. There are no hidden retainers, no opaque 'project management overhead' percentages, and no surprise invoices for incidental work. When scope changes arise — as they inevitably do in software development — ABC Company presents change requests with the same level of estimation rigour applied to the original proposal, enabling clients to make fully informed decisions about how to proceed.

3. Dedicated Named Teams

Clients working with ABC Company are not assigned to a rotating pool of available engineers. Each engagement is staffed with named team members who remain on that engagement for its duration. Clients know exactly who is working on their product, can build working relationships with those individuals, and benefit from the accumulated project context that a stable team develops over time. This commitment to continuity is backed by ABC Company's average engineer tenure of 3.4 years — significantly above the industry average for technology services firms — which means that the people assigned to a client's team are likely to still be there six, twelve, or eighteen months into the engagement.

4. Full Intellectual Property Ownership

Every piece of software, design, documentation, and infrastructure configuration produced in an ABC Company engagement is work-for-hire. Clients own 100% of the intellectual property from the moment it is created, with no licensing back to ABC Company, no source code escrow arrangements, and no contractual restrictions on how the client uses, modifies, or transfers the work. This policy applies to all engagement types: fixed-price projects, time-and-materials retainers, and staff augmentation placements. ABC Company's standard master service agreement makes this assignment explicit and irrevocable, ensuring that clients can take their codebase to any other vendor, bring it in-house, or open-source it without requiring any consent from ABC Company.

5. Timezone Flexibility

ABC Company's three-office, three-continent footprint gives it a practical timezone range that few technology services firms can match. The company's primary development operations run on CET overlap (UTC+5:30), with EST and PST overlap available through structured shift scheduling in Colombo and through the London team. AEST coverage is provided natively by the Melbourne office. For clients in North America who have been frustrated by asynchronous offshore experiences, ABC Company can structure its team's working hours to provide four to six hours of real-time overlap with US East Coast business hours, enabling the kind of synchronous collaboration that drives alignment and reduces feedback loop latency.

6. End-to-End Delivery Capability

ABC Company covers the full software delivery lifecycle under a single engagement umbrella: product strategy and requirements definition, UX research and interface design, frontend and backend engineering, mobile development, QA and test automation, DevOps and cloud infrastructure, security review, and post-launch maintenance and support. Clients do not need to coordinate across multiple specialist vendors or bridge gaps between a design agency, a development shop, and a DevOps consultancy. This integrated model reduces coordination overhead, eliminates the handoff problems that occur at vendor boundaries, and gives ABC Company full visibility and accountability across the entire product delivery chain.

7. Company at a Glance

The metrics below summarise ABC Company's scale and reach as of mid-2026, reflecting nine years of sustained growth and a deliberate approach to building depth before breadth.

These figures represent the current state of a company that has grown organically, without venture capital pressure to scale at the expense of quality. Every project delivered, every client retained, and every professional hired reflects a deliberate decision about where ABC Company can add genuine value and where it cannot. The company's selective growth approach is itself a quality signal: the same engineering culture and delivery standards that defined a 12-person team in 2016 continue to govern a 60-person organisation today.

8. Contact Information

ABC Company welcomes enquiries from organisations considering a technology partnership. The easiest way to start a conversation is via email; the business development team aims to respond to all initial enquiries within one business day.

Email	hello@abccompany.io
Website	www.abccompany.io

Office Addresses

Office	Address
Colombo HQ	42 Galle Road, Colombo 03, Sri Lanka
London	71 High Holborn, London WC1V 6DA, United Kingdom
Melbourne	120 Spencer Street, Melbourne VIC 3000, Australia

All offices observe local public holidays. For time-sensitive initial enquiries, email is monitored across all three time zones during business hours. Existing clients should contact their named account manager directly for ongoing engagement queries.
