

INTERNAL NOTES — Software Project

Date: ???

Attendees: Thomas, Katrin, finance guy (didn't catch his name)

=====

System: need to replace the old logistics system. its falling apart.
Current downtime is ~4hrs/week. Drivers are complaining.

Requirements (rough):

- fleet tracking (GPS, live map showing all trucks)
- driver mobile app (android only? check with Katrin)
 - * needs to work offline in rural areas!!
 - * basic stuff: route display, delivery confirmations, photo proof
- route optimization — "like google maps but for our trucks"
Thomas wants AI-powered optimization. Katrin says lets start simple.
- customer portal for tracking deliveries
 - * real-time ETA updates
 - * delivery confirmation emails
- integration with SAP
(thomas says this is CRITICAL but nobody knows the API version)
(current SAP is on-prem, might be 4 years old?)

Budget:

Katrin said "not more than 80k euros"
Thomas thinks we need at least 150k "to do it properly"
*** No final approval from management yet ***
Need to present to board in July

Timeline:

- ASAP
- Katrin wants it by end of Q3 2026 (September)
- Thomas says thats impossible, "maybe Q1 2027 if we're lucky"
- Realistically???

Current tech:

- PHP 5.6 (!!!) / MySQL 5.5 on a physical server in the basement
- No CI/CD, deployments are manual FTP uploads (I know...)
- Single server, no redundancy

- They want to move to cloud
- CEO is worried about "data sovereignty" – all data must stay in EU
- GDPR compliance needed

Random notes from discussion:

- Thomas mentioned a competitor called SwiftRoute or something
 - wants "something like what they have but for our size"
- Need to check if we can reuse any of the old PHP code
 - (probably not, its PHP 5.6 spaghetti code – Katrin's words)
- They have about 85 trucks, 120 drivers, serve DACH region
- Current customers: ~340 active accounts
- Forgot to discuss testing/QA requirements entirely
- Also forgot about reporting/analytics – Thomas wants dashboards
- TODO: get actual requirements from warehouse team
 - (they weren't in the meeting and apparently have a "long list")

OPEN QUESTIONS:

1. Mobile app: native or cross-platform?
2. Who is the actual project owner on their side? Thomas? Katrin?
3. Do they have anyone technical internally? (DBA? DevOps?)
4. What data exactly needs to stay in EU vs whats ok elsewhere?
5. SAP version and available API documentation??
6. Is the 80k or 150k the real number? Or something in between?
7. Can we get access to the current system for an audit?

Next steps:

- Thomas will "send something over" (this document I guess)
- Follow up call next week? (no date set)
